

Project Brief

## Guam Shell Dock

### Corrosion Protection

Guam  
2005

The Tyfo® SEH System was utilized to provide corrosion protection to existing steel piles for an oil dock in Guam. The atmospherically exposed sections of the steel piles were completely wrapped as well as a four foot section below the splash zone of each pile.

Fibrwrap Construction utilized floating platforms and boats to gain access to the steel piles and contracted a diver to conduct the underwater wrapping.

The Tyfo® SW-1 Epoxy System (a specially formulated underwater epoxy) was used to provide added protection against the harsh ocean environments.
